PROJECTS

AUTOTYP is not a single individual database project. Rather, it is a large-scale research program involving various thematically specific projects. In each project we develop a series of [data and definition files](#) linked together relationally. Currently, the number of files across all projects is about 70. All database files are currently implemented in FileMaker Pro™ for the Macintosh, but will in due time be transferred into a more general, platform independent format.

The following projects are fully implemented and data collection is currently proceeding full steam (click for further information). Lines indicate the most important relationships between projects. (Most projects are interconnected via shared definition files anyway.)

II. Words: Phonological & Grammatical

- Definitions
- Examples from database

The Phonological Word ω

- Selkirk (1980); Booij (1983; 1984; 1985); Nespor & Vogel (1986); Peperkamp (1997); Inkelas (1987); McCarthy & Prince (1993); Hall & Kleinhenz (1999); Wiese (1996); Dixon & Aikhenvald (2002)
- A phonological domain that references morphological information = **Phonological Word**

Phonological processes/ rules/constraints that...

- Reference domains ‘beyond the syllable’
- Also reference some morphological or morpho-syntactic domain (e.g. root/stem; stem + affix; stem + stem, etc.)
- ‘morpho-phonology’

P-word in German (“Onset Maximization” Booij 1985; Wiese 1996

Onset: *bl* surfaces word-initial:

1. *blitz* -> [blɪts] ‘lightning’

Coda word-medial: *bl* will often resyllabify:

2. *bibl + isch* -> [bi.blɪʃ] ‘biblical’

= ‘Onset Maximization’

Surfacing coda obstruents devoice

3. *Lob* -> [lo:p] ‘praise’

Rad -> [ʁa:t] ‘wheel’ = ‘Final Devoicing’

German P-word

- *lieb + e* love-1SG.PRES -> [li:.bə] 'I love...'
- BUT: *lieb + lich* love-ADV -> [li:p.liç] 'dearly'
 - no onset maximization for a *bl-* cluster
 - rather, /b/ devoices to [p]
- Consonant-initial suffixes parsed as their own domains for this process (separate p-domains)
- $(libə)_\omega$ & $(bibliɔ)_\omega$ vs. $(lib)_\omega (liç)_\omega$
- Domain of ONSET MAX: stem ± v-initial suffix
- Prefixes excluded: *ab-ändern* [$(? \Lambda p)_\omega. ? \epsilon n. d \epsilon \kappa n$]
- Compounds excluded: *bergabfahrt* [$(b \epsilon \kappa k)_\omega. ? ap. fa \kappa t$]

German Onset Max Word

Notes

data: Jochen Geifuss-Wolfgang (Autotyp Bib); Hall 1999; Booij 1985; Wiese 1996

ONSET MAXIMIZATION applies if 2nd syllable or morph is v-initial. If cv(c), then no ONSET MAX, and rather devoicing of stem/1st syllable coda C:

lieb + e => [li:bə] 'love.1sa' vs. lieb + lich => [li:b.lɪç] 'dearly'

Manange (Tibeto-Burman)

- Single Tone Contour Word = stem ± prefix± suffix ± particle ('clitic')
- For example, tone /3/: a high, sharp falling tone
- [sΛ⁵³] 'good/tasty/wholesome'
- [a⁵⁴-sΛ⁴³] NEG-good 'not good'
- [a⁵⁴-sΛ⁴³-pΛ^{32/22}] NEG-good-NOM 'not good one'
- [kjẽ¹¹ a⁵⁴-sΛ⁴³-pΛ=ko³²] rice NEG-good-NOM=DEF 'the bad-tasting rice'

G-Words

- In **morphology** & **syntax**: general assumption of a maximum of 2 or 3 domains:
 - M (Σ , Root, Affix)
 - X^0 (Any syntactic head/terminal node)
 - XP (Any syntactic phrase)
 - Other accounts of grammatical units also very general:
 - Fixed combination or ordering possibilities for elements
 - A certain “conventionalized meaning”
 - A degree of coherence
- (e.g. Dixon & Aikhenvald 2002)

G-word in Belhare (Tibeto-Burman)

WTID 234	LID 35	Belhare	UNIT g-domain	Inputter 24 Kristine

Notes e.g. phak se'-yu pig 3sS-kill-NPST; phak 'pig' cannot project a phrase of its own in this type of construction

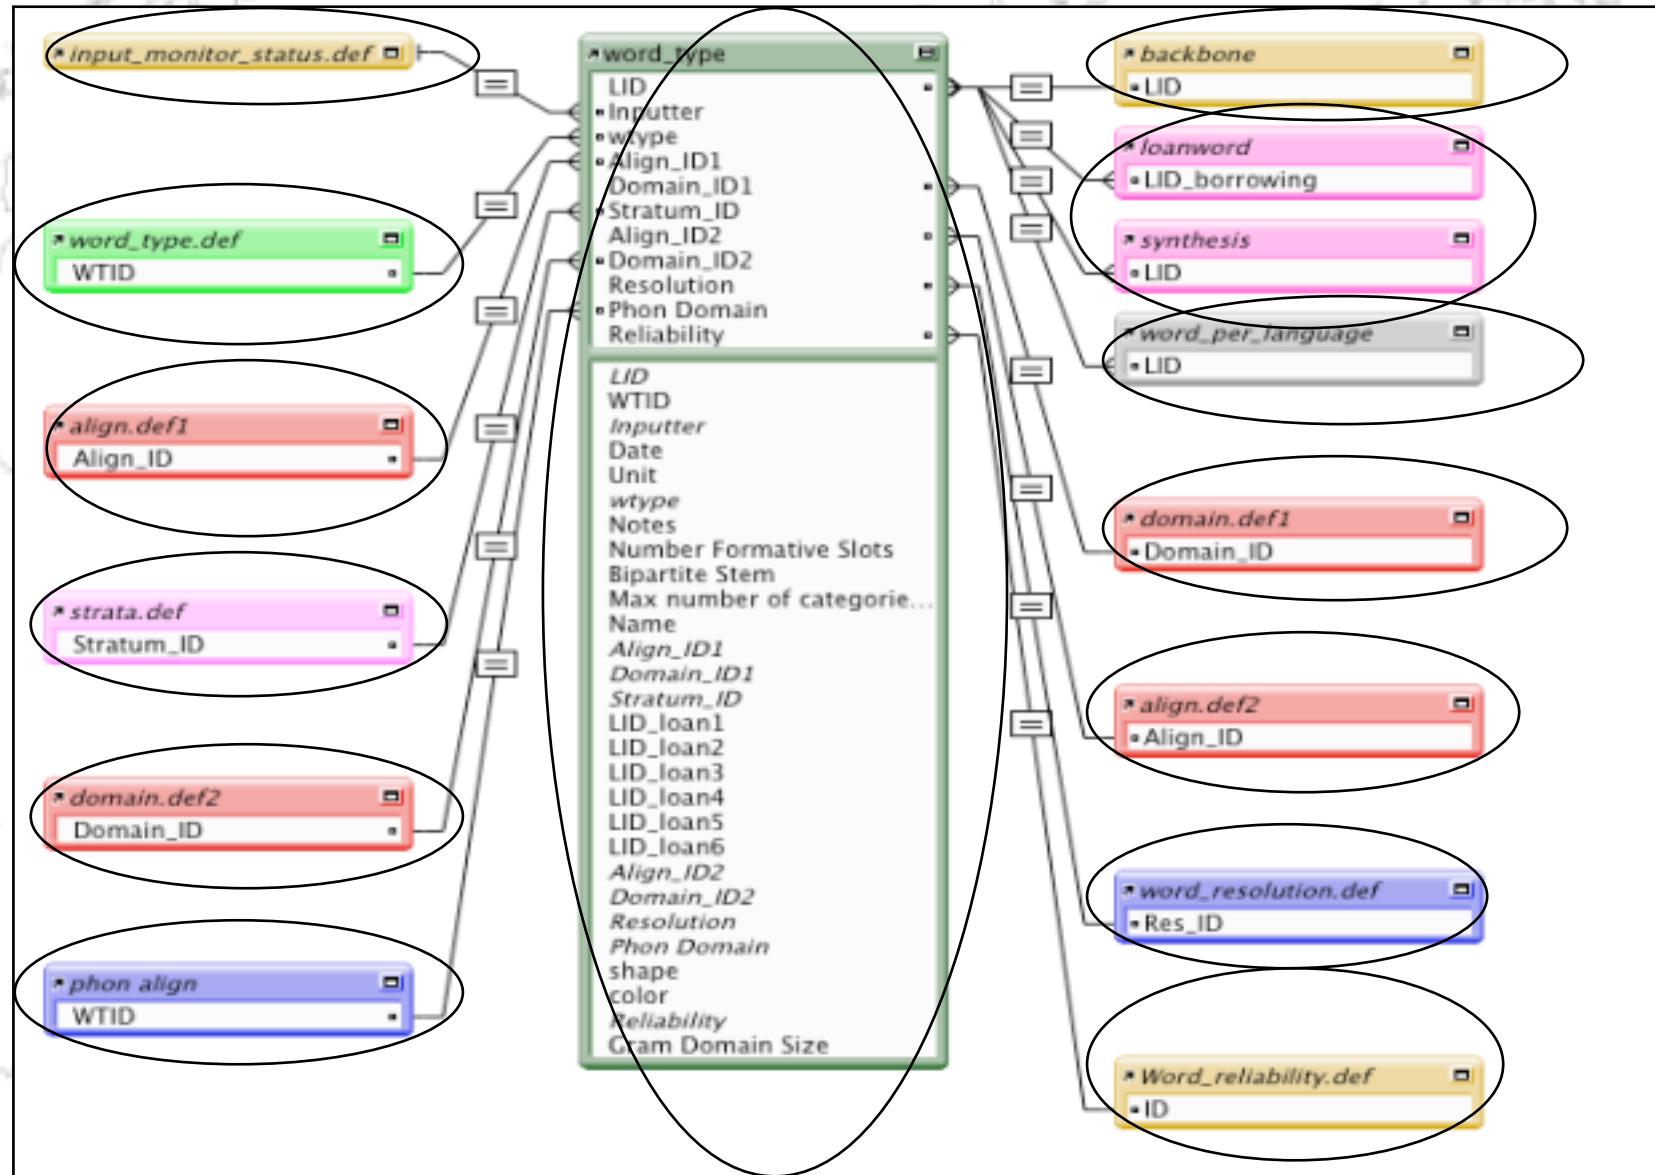

Belhare ‘Terminal Word’

- Domain: (object+intransitive affixes) ± all stem parts +affixes
- p^hak seʔ-yu
pig [3sS-]kill-NPST
'S/he kills pigs'
- p^hak 'pig' cannot project a phrase on its own:
**eik^ha p^hak seʔyu 'S/he kills big pigs'*
- Not incorporation: p^hak=to seʔyu

III. A comprehensive catalogue of word types

- Description of process/constraint & resolution (if applicable)
- Description of phonological domain & alignment type
- Description of grammatical domain & alignment type
- Exceptions or ‘strata’
- Distribution of types, sizes, alignments

What goes into Word Records?

In addition to Manange...

Notes Dixon notes that a phonological unit may not be more than 7 syllables in size (not true for non-cohering affixes); need more morph detail on participatory affixes

IV. Traditional Approaches to P & G Domains

- The Prosodic Hierarchy
- Prosodic, Grammatical Alignments, & Cross-Domain Alignments
- What we are finding so far...

Prosodic Hierarchy

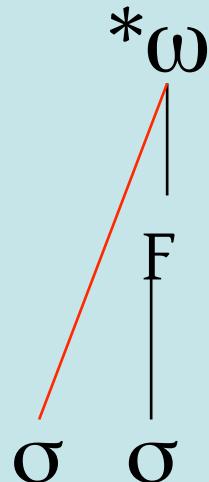

Series of nesting domains for phonological rules/processes

Prosodic Hierarchy: Alignment

- UG specifies these prosodic constituents, arranged in a hierarchy
- Hierarchy characterized by principles & constraints (Selkirk 1980; Nespor & Vogel 1986)
 - Strict Layer Hypothesis: “A prosodic constituent of rank n is immediately dominated by a single constituent of rank $n + 1$ ”

Alignment: Strict Layer Hypothesis

'skipping' of a level

'recursivity' of levels

- Recursivity permittable (Ladd 1986)
- Violable constraints (Optimality Theory) (Ito & Mester 1992; Selkirk 1995; Peperkamp 1997):
 - NONRECURSIVITY: No C_i dominates another C_i
 - EXHAUSTIVITY: No C_i immediately dominates a C_k , $k < i-1$
- Non-Recursivity (Truckenbrodt 1999)=
 - P-phrases in recursive structures must be maximally alike in extension

Grammatical Domains: Alignment

- Correspondence constraints kept very general:
 - ALIGN (PCat, Edge; GCat, Edge), where PCat = { μ , σ , F, ω , ϕ } and GCat = {Af, Rt, Σ , X^0 , XP} (McCarthy & Prince 1993)
 - Wrap-XP (Truckenbrodt 1999) Syntactic phrases are contained within only 1 phonological phrase
 - Tautomorphemicity (Crowhurst 1994; Bickel 1998; 2003)

$*(G\text{-cat1})(G\text{-cat2})$

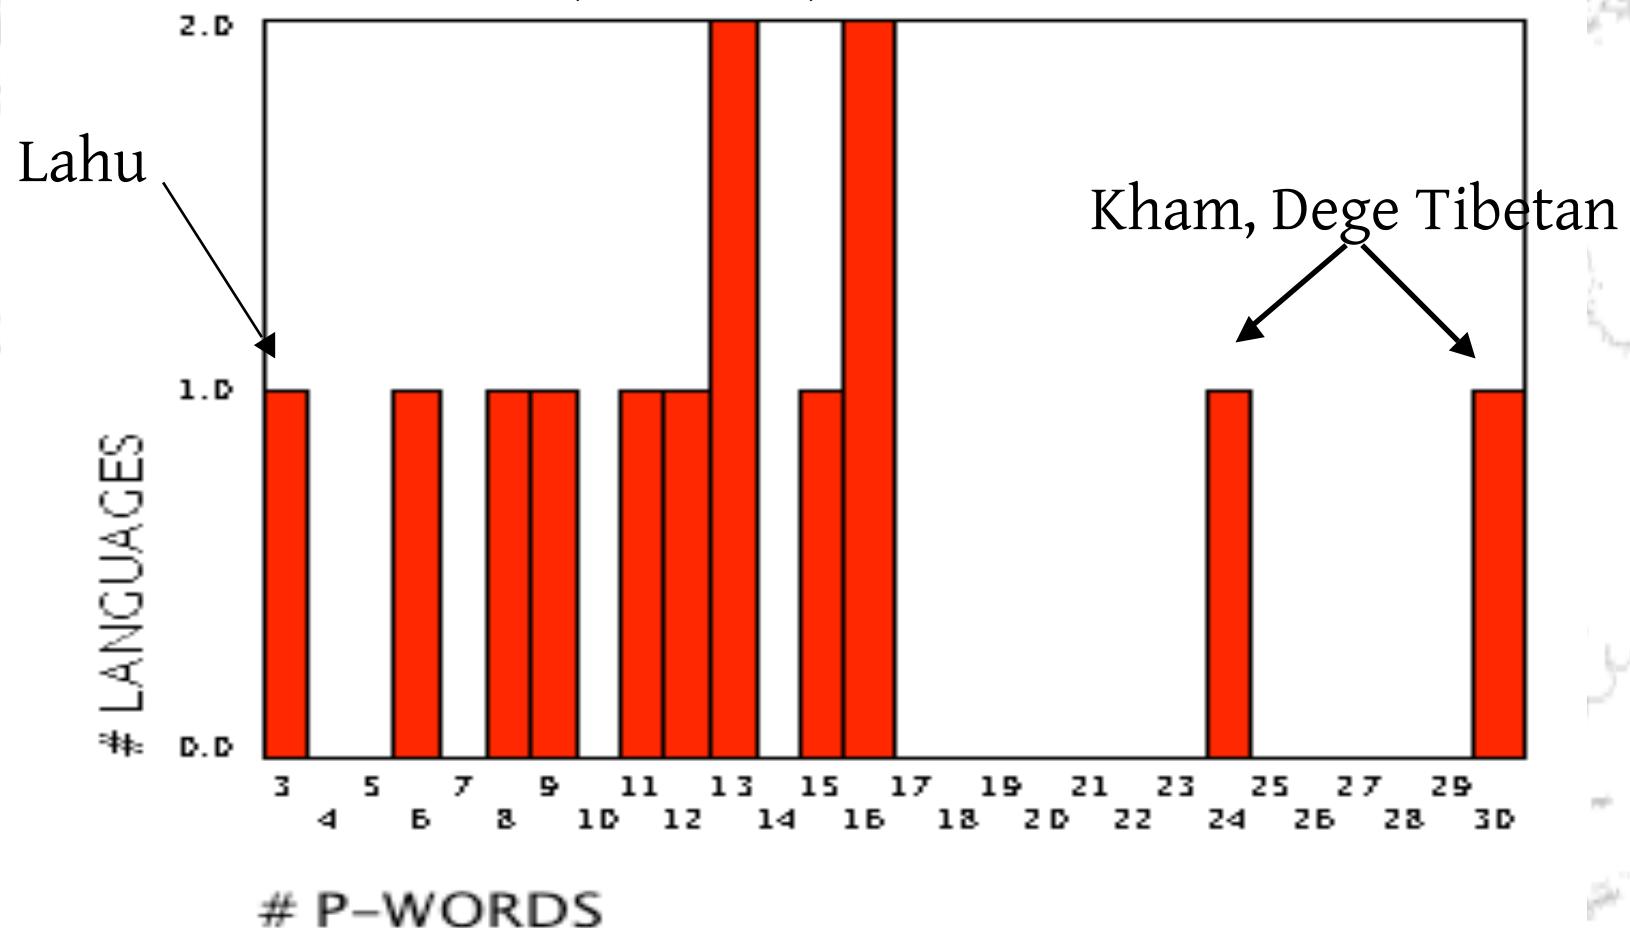

[P-CAT]

Our Findings: Diversity in Word Domains

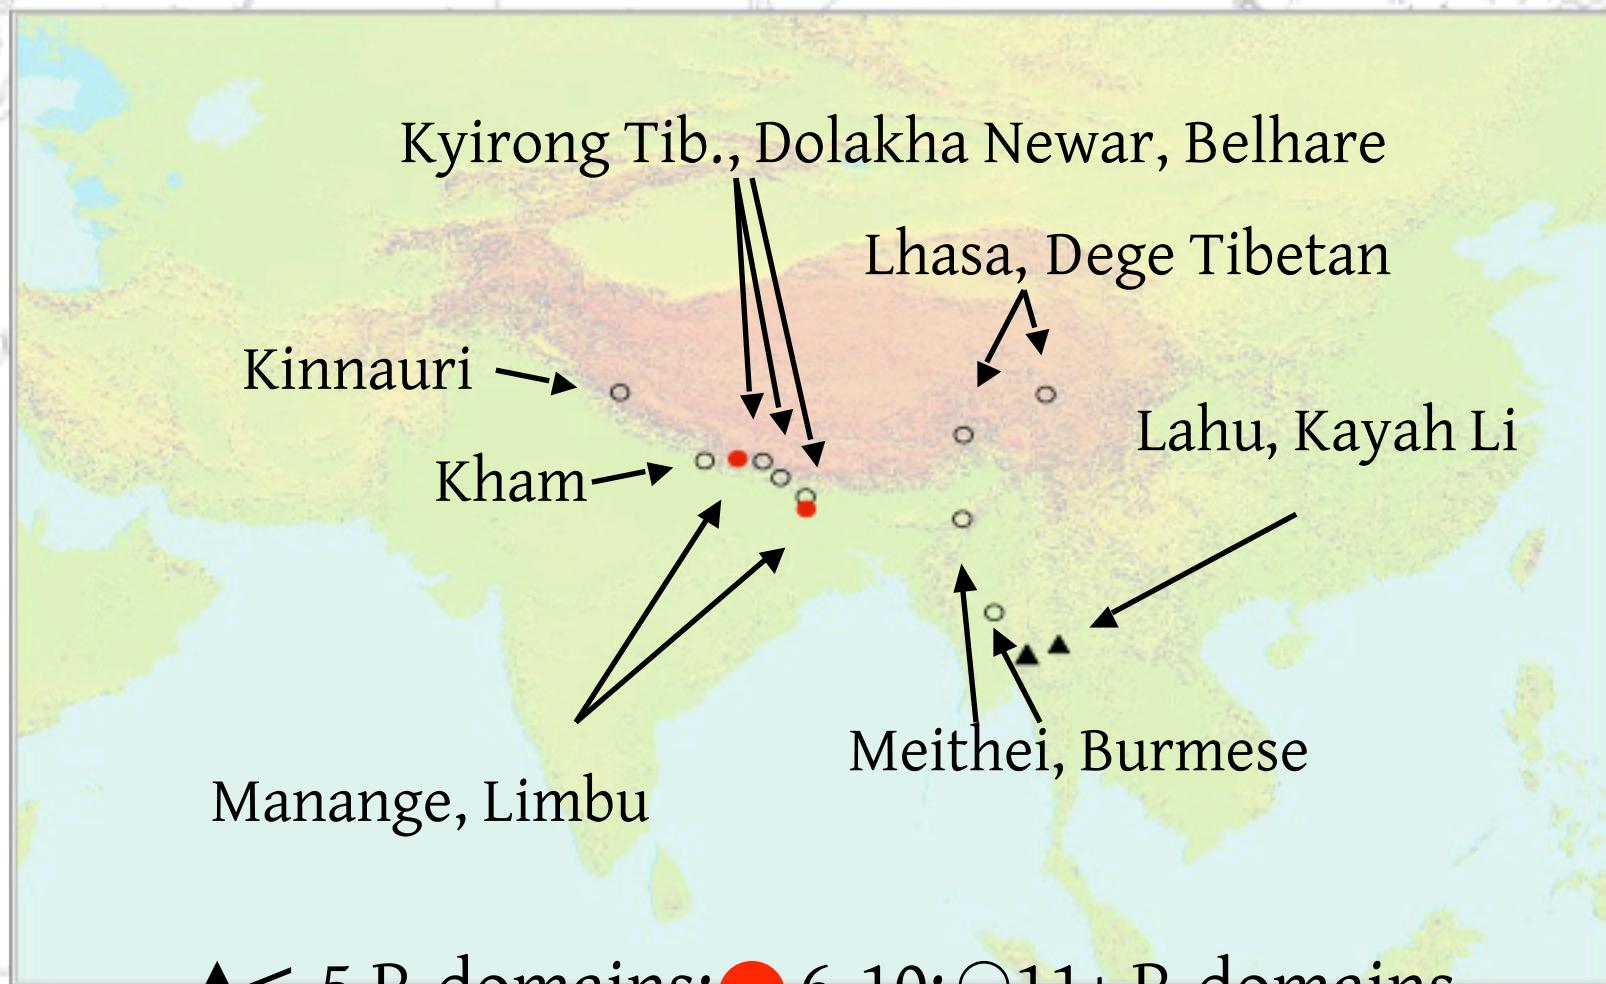

- Languages often differentiate more than one P-domain
- Different P-domains reference different morphological information (non-isomorphism)
- P-domains not necessarily contained within each other à la traditional ‘recursion’ expectations

Numbers of P-Word Types: 13 Sino-Tibetan Languages

Kinnauri, Meithei, Lhasa Tibetan

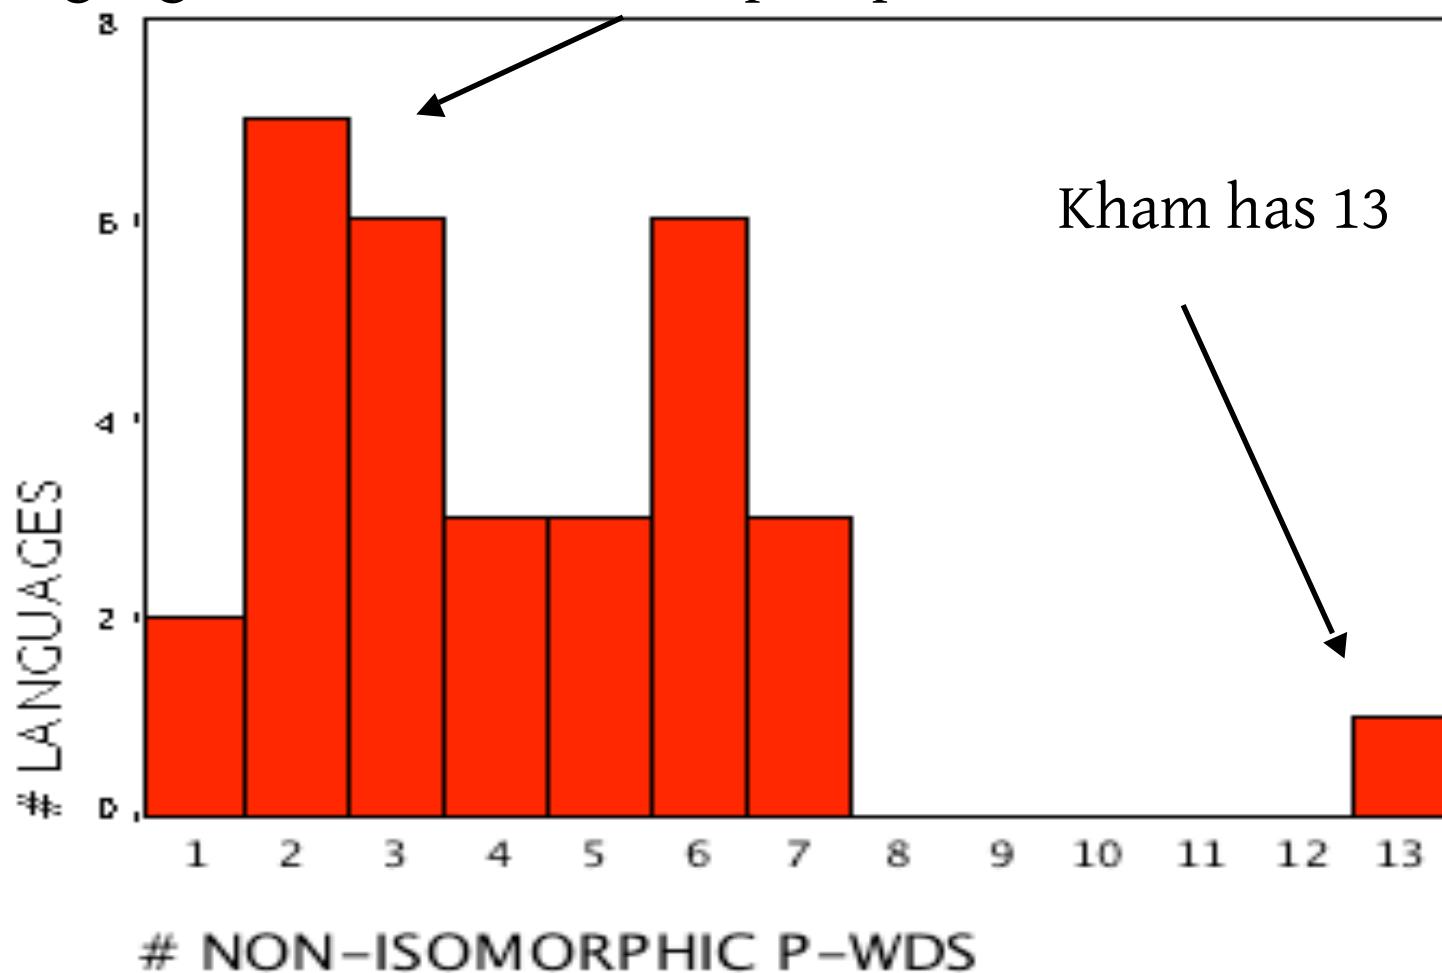

Geographic Distribution: Sino-Tibetan

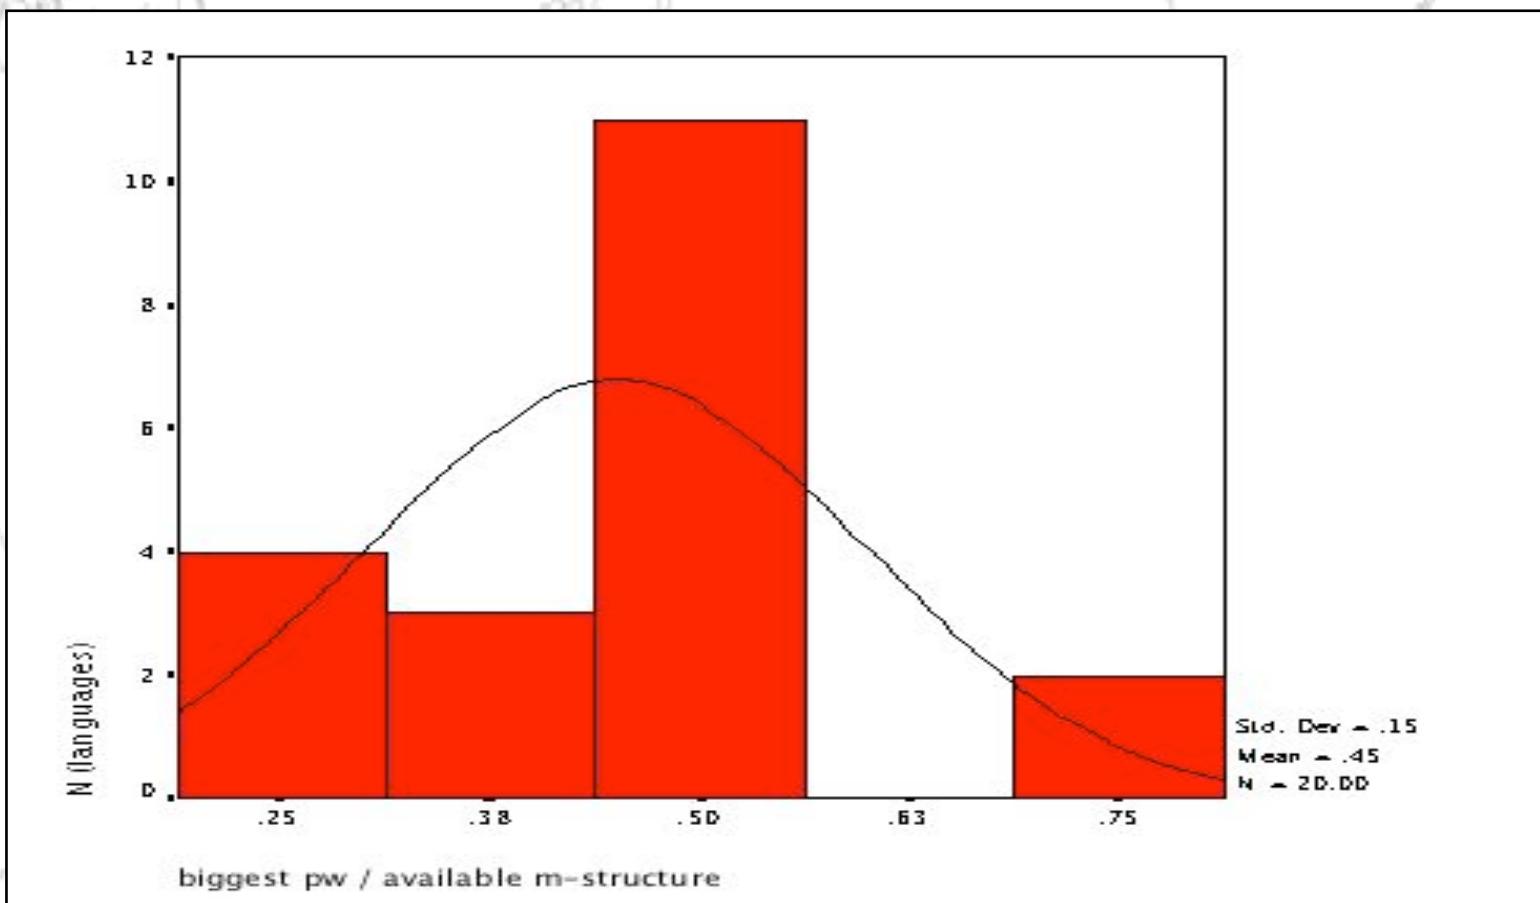

▲ \leq 5 P-domains; ● 6-10; ○ 11+ P-domains

Non-Isomorphism: 27 languages

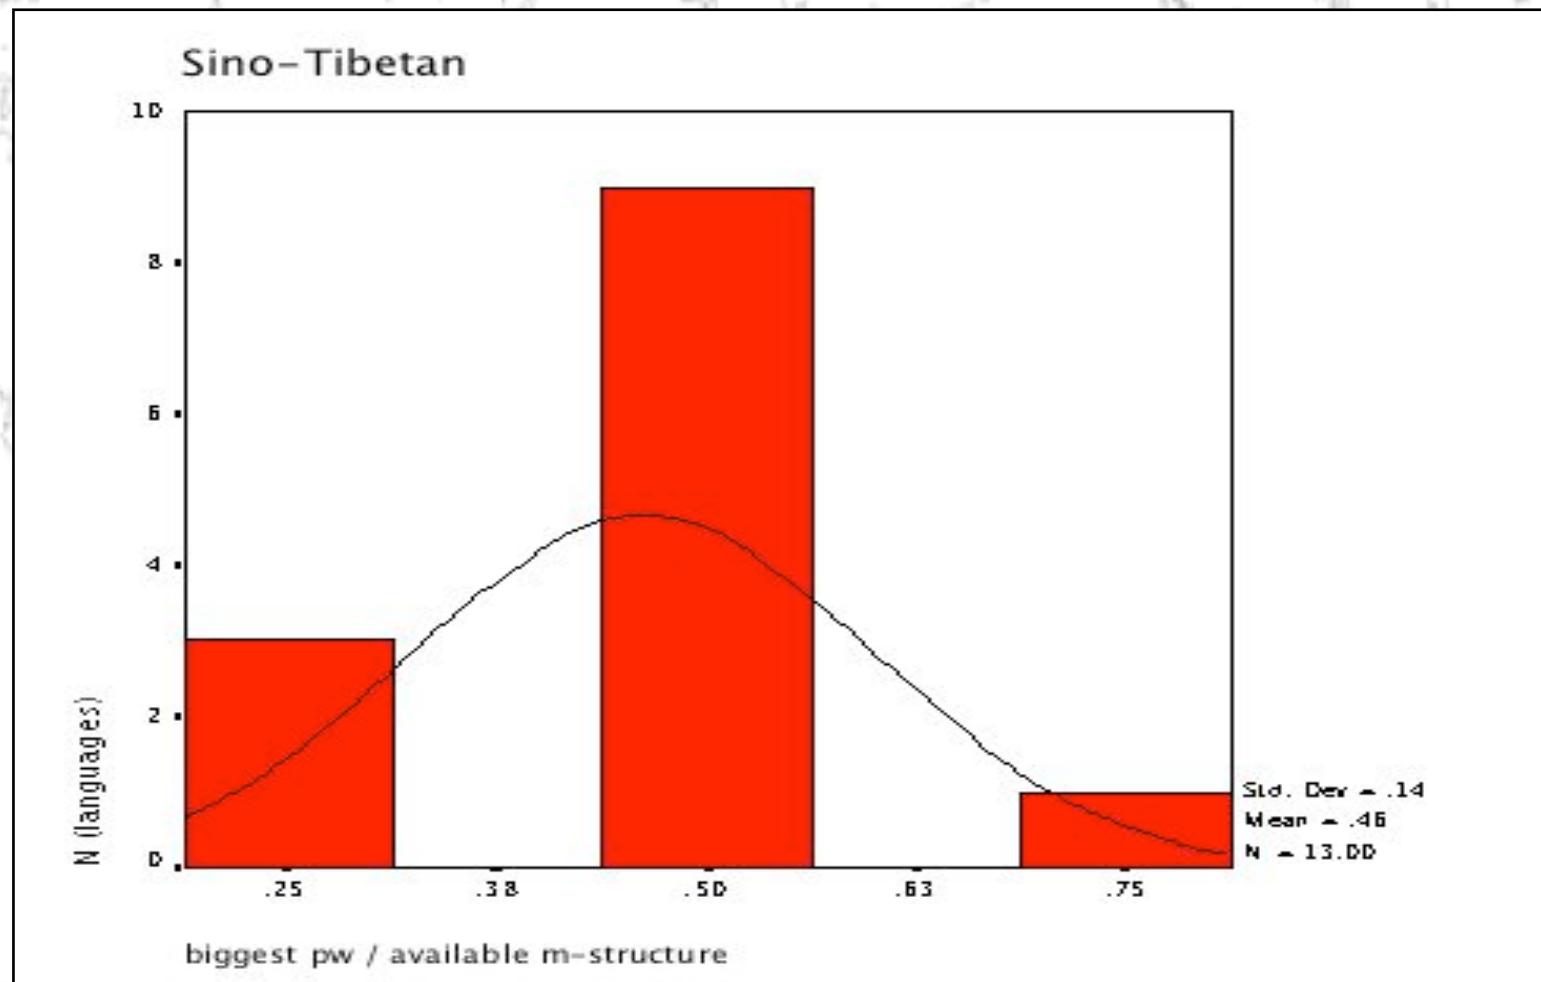

7 languages with 2 non-isomorphic p-words

Based on Available Morpheme Structure

Ratio: Sino-Tibetan only

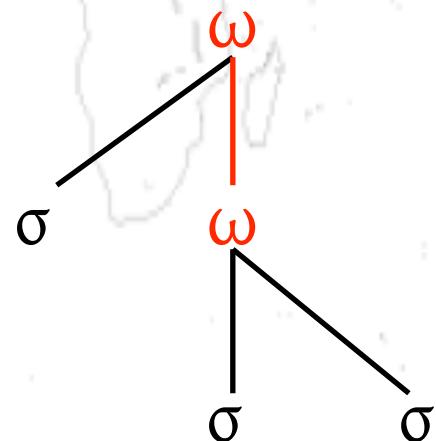

Recursion: Lahu (Sino-Tibetan)

PW1: Reduced Stress

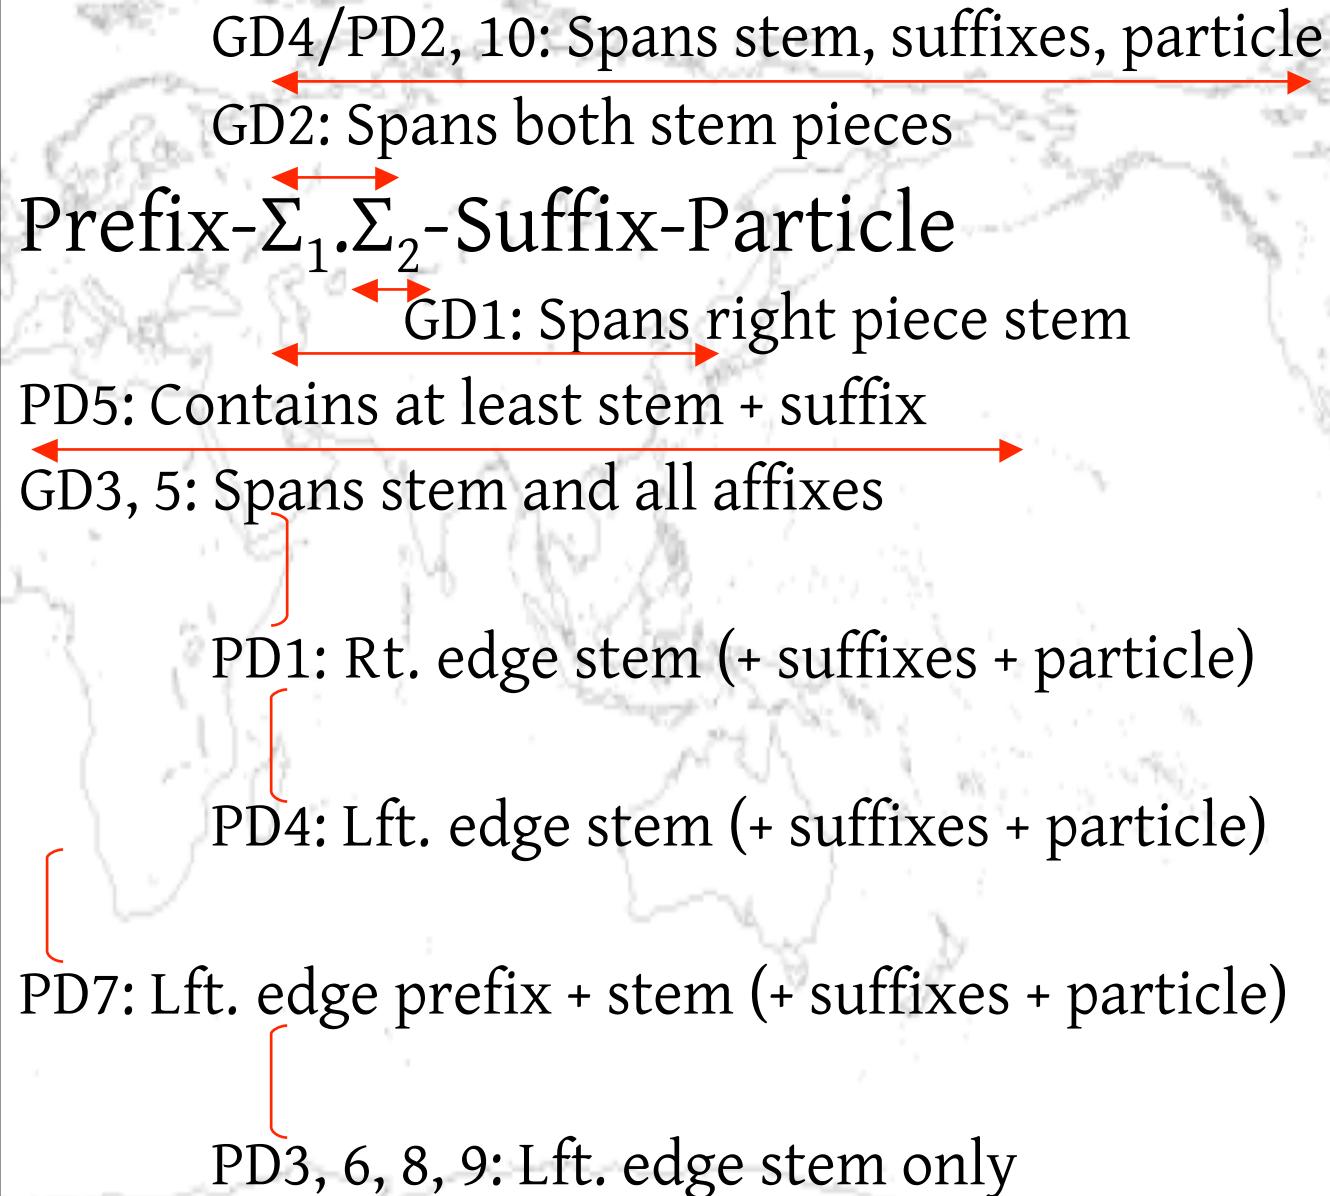

←→ prefix-stem-suffix

←→ PW2: Stem Tone Change

Recursion: Belhare

- Belhare: 12 P-domains; 6 G-domains
- Bipartite Stems

V. Future Goals

- Catalogue & Typologize on diversity of domain types
- Focus: Sino-Tibetan & Austro-Asiatic vs. ‘World’ sample
- Enhance database with very detailed information (e.g. Questionnaires)
- Outcome: updating of traditional terminologies: fusion types, affix~clitic~particle

“The Questionnaires”

- <http://www.uni-leipzig.de/~autotyp/download/index.html>
- Designed for use in multiple settings, scenarios:
 - Reading/writing of grammars & descriptive phonology
 - Fieldwork/elicitation
 - Transcription & analysis of text data
- P-domains: a ‘bottom-up’ approach:
 - σ >> polysyllabic, monomorphemic >> polymorphemic >> phrasal/clausal constructions...
 - charting phonology that is sensitive to morphological (& syntactic) structure

AUTOTYP: People and funding

- The AUTOTYP research team (as of October 2004)
 - Johanna Nichols (Co-Director, Berkeley)
 - Balthasar Bickel (Co-Director, Leipzig)
 - Tracy Hall (Co-Director, Word Domains, Indiana University)
 - Fernando Zúñiga (Research Associate, Eugene/Zürich/Manchester/Santiago)
 - Kristine Hildebrandt (Post-Doc, Leipzig)
 - *RAs in Berkeley:* Gabriela Caballero, Suzanne Wilhite
 - *RAs in Leipzig:* Michael Riessler, Sven Siegmund, Sindy Poppitz, Franziska Crell, Kathi Stutz, Josh Wilbur, Jenny Seeg, Anja Gampe, Sebastian Hellmann
 - *Past team members:* Sandra Biewald, Aimee Lahaussois-Bartosik, Dave Peterson, Keith Sanders, Alena Witzlack-Makarevich, Rebecca Voll
- Funding: Swiss NSF Grant Nos. 08210-053455 (1998-2001, Bickel) and 610-0627 (2001-2002, Bickel), German DFG Grant No. BI 799/2-1 (2003-2005, Bickel & Hall), US NSF Grant No. 96-16448 (1998-2001, Nichols)
